

Auto Clicker

Main Config

Toggle

- Click “not set” and press a keyboard button to choose a hotkey that will turn the Auto Clicker on/off

Delays - All delay values are in milliseconds

- Absolute Delay Min: The absolute minimum delay it can use
- Absolute Delay Max: The absolute maximum delay it can use
- Delay Target: The peak of the curve, the value most commonly used
- Delay Deviation: How far it can deviate from target and still remain common
- Weighted Distribution: This will turn the standard bell curve into a right shifted bell curve (Example Below)

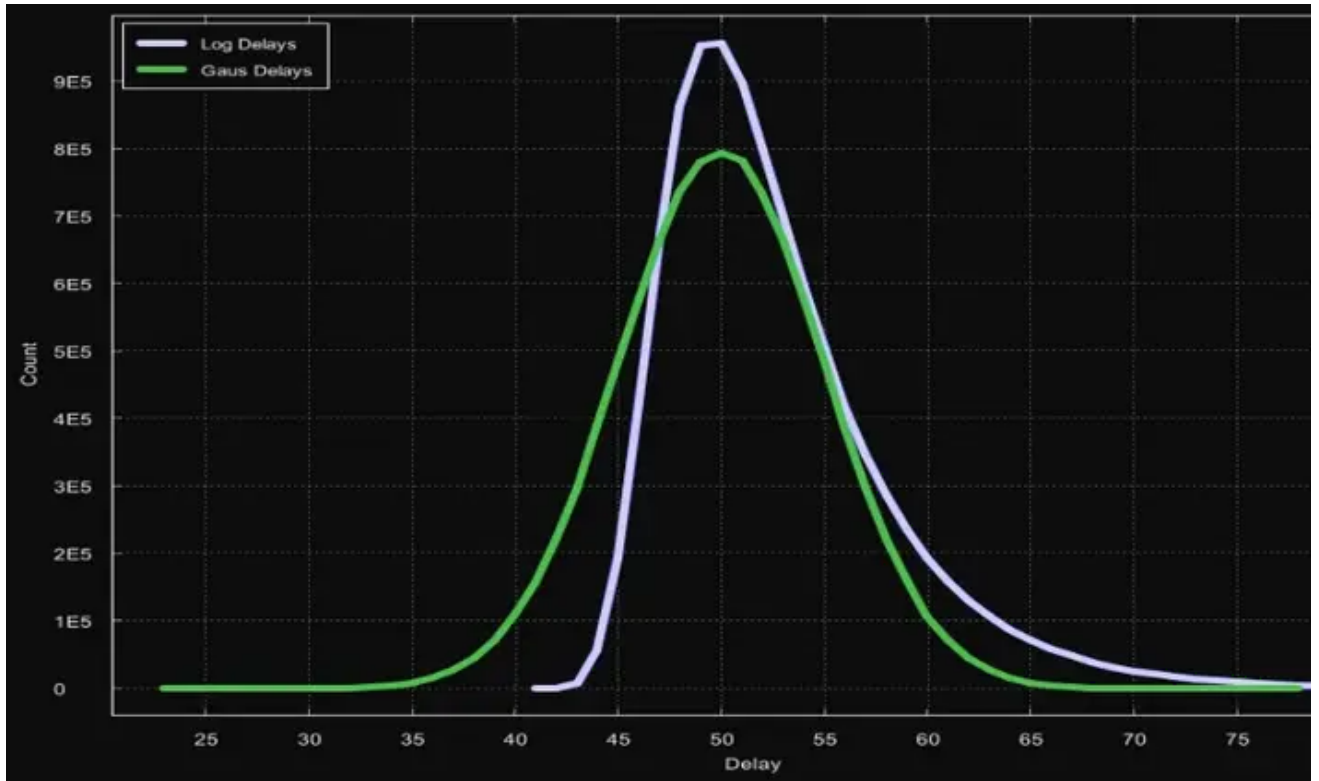

Use MouseEvents

- This will make the plugin use MouseEvents to click where you mouse was when you toggled the plugin on, instead of clicking where your mouse currently is, no longer requiring your mouse. Using this does increase the risk of the plugin

Click Distribution Examples

- Below is a picture of a 10,000,000 click sample size at settings min=20, max=80, target=50, deviation=5
 - Blue is a weighted distribution

- o Green is the standard distribution
